# Welcome

The Hilly brand continues to go from strength-to-strength and is rapidly becoming the leading technical running sock and accessory brand. Our business continues to develop both in the UK and abroad. In addition, our products are gaining growing popularity in the outdoor market, particularly with the increasing interest in trail running.

A major development this season will be the introduction of the next phase of our sock programme, which will move the brand to new levels.

We are continually looking at new developments and technologies in all product groups, working closely with our Technical Consultant Dr Ron Hill MBE, and our suppliers alike.

Technically advanced, performance led and value-for-money products, coupled with excellent customer service are key to Hilly's ongoing success.

WELCOME

# Socks

If you were to add the sale of a pair of technical socks to every pair of running shoes sold throughout the year; how much extra profit would you make? Many customers are unaware of the benefits technical socks provide and so you, the retailer, can offer that extra added service element to the consumer.

We find that once a runner has worn a pair of our technical socks then he/she will not return to non-technical socks again.

NEW PRODUCT

## The Science Behind Celliant

Can a fabric improve circulation? Celliant is a clinically proven fabric that uses scientific techniques to deliver the future of technology in the textile industry.

Celliant was initially developed in the 1990s by studying methods to improve natural healing in Asia and then subsequently developing those techniques so that they could be integrated into fibers that are used in clothes and other textiles. Hologenix developed a patent protected method for adding the minerals into the center of the fibers where they remain and provide benefits without affecting the quality of the yarn.

Celliant's blend of proprietary ingredients reflect light (both visible and infrared) back to the body changing the wavelength of the light so that it is more easily absorbed by the body. The energy from this light improves blood flow in the target area. Celliant works by increasing the amount of blood traveling into the affected area, not by causing the blood to absorb more oxygen.
